Letters to the Editor	3
Articles	
9/56 year cycle: earthquakes in Japan, Kamchatka and Alaska, <i>David McMINN</i>	7
Strangely, a 9/56 year effect could be established for Kamchatka but not for Japan. However, by combining the data from these two regions, correlates with 54/56 year and 9-45/56 year grids could be achieved for major earthquakes ($M \geq 8.1$).	
Massive solar eruptions and their contribution to the causes of tectonic uplift, <i>Robert JOHNSON</i>	16
Massive solar eruptions are likely to have occurred in past eras and that such eruptions will have caused electric discharges to the Earth's surface many orders of magnitude larger than present-day lightning strikes. The energy delivered directly to the crustal strata would have been sufficient to contribute to uplift of mountain ranges by thermal expansion.	
Airport communication as seismic precursor, <i>Arun BAPAT</i>	37
The difficulties experienced in communication between the incoming air plane and the landing airport could serve as a reliable seismic precursor. This happens due to Seismo-Electromagnetic effect.	
Relation of seismicity with surface faults in Pakistan: An overview, <i>Haleem Zaman MAGSI</i>	42
The seismicity of Pakistan is correlated with tectonic blocks and faults to determine sources and reservoir of kinetic energy in Earth crust. Subjacent Neotectonic process is the source of kinetic energy and tectonic blocks are reservoirs.	
Origin of oceans: Spreading versus primary oceans models, <i>Alexey V. KHORTOV, Alexander E. SHLEZINGER and Gleb B. UDINTSEV</i>	56
Lateral heterogeneities appearing due to irregular crystallization at the end of pre-geologic stage and resulting in origination of early pre-oceanic and pre-continental areas. The primary oceans model provides better conformity with geological and seismic data than the spreading model of modern oceans origins.	
Seismo-electromagnetic energy flow observed in the 16 March 2014 M6.7 earthquake offshore Tarapacá, Chile, <i>Dong R. CHOI</i>	61
The strong M6.7 offshore Tarapacá earthquake in March 2014 was generated by the convergence of two seismo-electromagnetic energies at the junction of two major fault systems.	
Australasia within the setting of global wrench tectonics, <i>Karsten M. STORETVEDT and Biju LONGHINOS</i>	66
Due to its equatorial seating, Australasia was particularly predisposed to wrench tectonic processes. Thus, beginning in the early Miocene Australia (with its SW Pacific extensions) rotated 70° counter-clockwise before interacting with SE Asia in the late Miocene.	
Discussion	
Global tectonics: Prediction and confirmation, <i>Peter M. JAMES</i>	97
Publications	
Climate and the atmospheric electrical circuit: The electromagnetic coupling between solar wind and Earth, <i>Giovanni P. GREGORI</i>	99
Communicating earthquake risk to the public: The trial of the "L'Aquila Seven", <i>David E. ALEXANDER</i>	113
The frontier of earthquake prediction studies, <i>Masashi HAYAKAWA</i>	113
Fukushima: Earthquake prediction in the shadow of consensus science, <i>Julian GRESSER, John CASEY and Dong R. CHOI</i>	113
The global climate status report, <i>John CASEY</i>	119
Electric Universe websites, <i>Louis HISSINK</i>	120
News	
European Geological Union General meeting, <i>Biju LONGHINOS</i>	121
14th IAGOT, Yunnan conference, <i>Lin GE</i>	122
